The Village of Lombard is proud to present to its residents the Annual Water Quality Report. This year’s edition covers water tested from January 1, 2022 through December 31, 2022. The Village is dedicated to providing the highest quality drinking water to its customers in the most reliable and professional manner. The goal of Village officials and staff is to achieve complete consumer confidence in our drinking water supply by maintaining a premier water system and open communication with our customers. This water quality report is intended to provide you with important information about your drinking water which includes drinking water facts, information on violations (if applicable), and contaminants detected in your drinking water supply. If you have any questions about this report, please contact Brian Jack, Utilities Superintendent at (630) 620-5740, or via email at jackb@villageoflombard.org. For more information, news, and special updates from the Village of Lombard, visit the newly updated Village web page at www.villageoflombard.org.

Community Participation

The Village Public Works Department continues planning improvements to the water distribution system through the Capital Improvement Plan. These improvements along with routine maintenance by the Department’s operational staff increase the safe, reliable, and efficient operation of the Village’s water system. The Village is committed to providing you with this information. We welcome you to attend any of our Public Works & Environmental Concerns Committee meetings held on the second Tuesday of every month or our Village Board Meetings held on the first and third Thursday of each month. Board Meeting agendas and minutes are posted in the Agendas & Minutes tab on the Village’s home page at www.villageoflombard.org. Want to learn more? Sign up for the Public Works Citizens Academy and get some hands on knowledge of how your water and sewer systems work!

That’s Some High-Quality H₂O

The Village of Lombard’s drinking water supply met all United States Environmental Protection Agency and state drinking water health standards and we are proud to report that no violations of a contaminant level or any other water quality standard were received in the 2022 sampling year.
Where Does My Water Come From?

Lake Michigan is the primary source of drinking water for the Village of Lombard. Pretreated finished water is received from the DuPage Water Commission via the City of Chicago’s Jardine Water Purification Plant, which is the largest conventional water treatment plant in the world! Lake Michigan is the only Great Lake that is entirely contained within the United States, bordering Illinois, Indiana, Michigan, and Wisconsin. It is the second largest of the Great Lakes by volume with 1,180 cubic miles or 1.299 quadrillion gallons (1,299,318,233,965,714) of water and third largest by area. As water is received from the DuPage Water Commission, it is stored in two elevated storage tanks and two underground reservoirs totaling 5.6 million gallons. The water in the elevated tanks and reservoirs remain in constant motion to maintain freshness. Only a small amount of chlorine is added to the water as it is pumped into the Village’s 184 miles of water mains. To ensure purity, water samples are routinely collected throughout the water system, from the source right to your home. A State-certified laboratory tests the samples using equipment that can measure substances down to one part in one billion! In 2022, a total of 1.299 billion gallons of water was pumped from the four receiving stations, averaging 3,369,000 gallons per day or five and a half olympic swimming pools per day. The Village also maintains three wells for emergency purposes, which are tested regularly to ensure that they will be ready if needed.

The Water Treatment Process or “Treatment Train”

Water from Lake Michigan is drawn into intake cribs about two miles offshore at depths of 20-30 feet below the surface. Water is then pumped in 10-20 foot diameter tunnels that are 200 feet below the lake bed to the water purification plants on the shoreline. Water is treated in a “treatment train” that includes coagulation, flocculation, sedimentation, filtration, and disinfection. Coagulation removes dirt and other particles suspended in the raw water by adding chemicals (coagulants) to form tiny sticky particles called “floc” which attracts other dirt particles. Flocculation (the formation of larger flocs from smaller flocs) is achieved by using gentle, constant mixing. The heavy particles settle naturally out of the water in a sedimentation basin. The clear water then moves through sand and gravel filters to remove even smaller particles. A small amount of chlorine is added to kill bacteria and microorganisms that may be in the water before it is pumped to your home.

The Treatment Train – Lake Michigan to Your Home
City of Chicago Source Water Assessment Summary

The Illinois EPA implemented a Source Water Assessment Program (SWAP) to assist with watershed protection of public drinking water supplies. The SWAP inventories potential sources of contamination to determine the susceptibility of the source water to contamination. The Illinois EPA has completed the SWAP for our supply. Further information on our community water supply’s SWAP is available by calling the City of Chicago’s Department of Water Management (CDWM) at (312) 742-2406.

The Illinois EPA considers all surface water sources of community water supply to be susceptible to potential pollution problems. The very nature of surface water allows contaminants to migrate into the intake with no protection only dilution. This is the reason for mandatory treatment for all surface water supplies in Illinois.

Chicago’s offshore intakes are located at a distance that shoreline impacts are not usually considered a factor on water quality. At certain times of the year, however, the potential for contamination exists due to wet-weather flows and river reversals. In addition, the placement of the crib structures may serve to attract waterfowl, gulls and terns that frequent the Great Lakes area, thereby concentrating fecal deposits at the intake and thus compromising the source water quality. Conversely, the shore intakes are highly susceptible to storm water runoff, marinas and shoreline point sources due to the influx of groundwater to the lake. To view a more detailed source water assessment, access the Illinois EPA’s website at:
http://dataservices.epa.illinois.gov/swap/factsheet.aspx

For more information regarding the City of Chicago’s Source Water, please contact:
Department of Water Management,
Bureau of Water Supply at (312) 742-2406.

Lead and Drinking Water

The Village of Lombard is required by the IEPA to monitor for lead and copper in drinking water every three years. The sample results for lead and copper in this report are from the 2020 sample year and the next round of samples will be in July of 2023.

The Village of Lombard does not have lead in its drinking water. However, lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We cannot control the variety of materials used in plumbing components. You can minimize the potential for lead exposure by flushing your tap for 3 to 5 minutes before using the water for drinking or cooking. Do not boil water to remove lead. Boiling water will not remove lead and may increase the concentration as water evaporates.

The Village is required maintain a lead water service line inventory as well as to notify homeowners if construction or repair work is completed on water mains or water meters and provide information on how to minimize your exposure to lead following water main disturbance.

You can see if your home has a lead water service line by viewing the Lead Water Service Inventory Map and find information about the Lead Water Service Line Replacement Reimbursement Program on the Village’s web page:
www.villageoflombard.org/417/Lead-in-Drinking-Water

For more information on lead in drinking water, testing methods and steps you can take to minimize exposure, contact the Safe Drinking Water Hotline at (800) 426-4791 or go to http://www.epa.gov/safewater/lead.

Or, you can always contact Public Works at: (630) 620-5740 or publicworks@villageoflombard.org
2022 Voluntary Monitoring and Cryptosporidium

The City of Chicago has continued monitoring for Cryptosporidium, Giardia and E. coli in its source water as part of its water quality program. No Cryptosporidium or Giardia was detected in source water samples collected in 2022. Treatment processes have been optimized to provide effective barriers for removal of Cryptosporidium oocysts and Giardia cysts in the source water, effectively removing these organisms in the treatment process. By maintaining low turbidity through the removal of particles from the water, the possibility of Cryptosporidium and Giardia organisms getting into the drinking water system is greatly reduced.

In 2022, CDWM also monitored for hexavalent chromium, also known as Chromium-6. USEPA has not yet established a standard for Chromium-6, a contaminant of concern which has both natural and industrial sources. Please address any questions or concerns to the Chicago Department of Water Management at (312) 744-8190. Data reports on the monitoring program for Chromium-6 are posted on the City’s website which can be accessed at the following address below:

Substances That May Be in Drinking Water

To ensure that tap water is safe to drink, the U.S.EPA prescribes regulations limiting the amount of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily indicate that the water poses a health risk. The sources of drinking water (both bottled and tap water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, in some cases it dissolves naturally occurring minerals, in some cases radioactive material, and substances resulting from the presence of animals or from human activity. Substances that may be present in source water include:

- **Microbial Contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- **Inorganic Contaminants**, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining or farming.
- **Pesticides and Herbicides**, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- **Organic Chemical Contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- **Radioactive Contaminants**, which can be naturally - occurring or be the result of oil and gas production and mining activities.

Important Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. Persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline 800-426-4791.
Coronavirus and Drinking Water

The Coronavirus or COVID-19 has not been shown to be spread through drinking water. The Village of Lombard’s Water Operators and Underground Utility Worker continued to work through the COVID pandemic to ensure the residents of Lombard continue to have safe reliable drinking water. The Center for Disease Control’s (CDC’s) first piece of advice to prevent the spread of COVID-19 is to wash your hands with soap and water for at least 20 seconds, especially after you have been in a public place, after blowing your nose, coughing, or sneezing. Without safe water from the tap, this simple, but critical step to protect against COVID-19 would not be possible. Visit the CDC web page for more info on hand washing. https://www.cdc.gov/handwashing/when-how-handwashing.html

The water and sewer workers of the Village may not always be in the public eye compared to our police and fire departments, but they are always on the job monitoring pumps and water flows both in and out of your home and business. You may see them repairing a water main break in frigid temperatures in the middle of the night, working to keep our sewers flowing, taking water samples, or helping our residents with issues in their homes. They are essential workers who have remained on the job throughout the pandemic.

Village of Lombard - IL Section AWWA Water Ambassador Gold Level

Essential. Reliable. Invaluable. Water—it’s the thread that weaves together our daily lives. It keeps our communities healthy, our cities running, and our economies growing. Water is a cup of coffee, the produce aisle, better production, increased exports, and greater American strength. While essential, water infrastructure is largely invisible. Few people realize what it takes to treat and deliver drinking water every day or how wastewater is cleaned so that it can be safely reused or returned to the environment. The high quality of life we enjoy would not be possible without water and the infrastructure that delivers it.

The ISAWWA Water Ambassador Program is an initiative to elevate public perception, knowledge, and consumer education of the water industry through a communication platform of educational and promotional content in a manner that is relevant and engaging. Lombard is one of nine Illinois communities that have achieved the Gold Level award for 2021. On social media platforms? Search #ilwaterambassador for posts and information about water!

Water Fun Facts: The United States uses almost 400 billion gallons per day. Europeans use an average of 50 gallons of water per day per person, Americans use an average of 100 gallons per day per person. The average Lombardian uses about 70 gallons per day. Sub Saharan African countries use two – five gallons per person per day!
What’s in My Water?

The City of Chicago Department of Water Management routinely monitors our drinking water for contaminants according to federal and state laws. The Village of Lombard collects 50 bacteriological samples each month, quarterly disinfectant by-product sampling, and monthly emergency stand-by well samples. The tables in the coming pages illustrate substances detected in our water for the period of January 1, 2022 through December 31, 2022. All of the substances listed are under the Maximum Contaminant Level (MCL) set by the U.S. EPA.

The Illinois EPA requires the Village to monitor for certain substances less than once per year because the concentrations of these substances do not change frequently. In these cases, the most recent sample data are included, along with the year in which the sample was taken.

Data Table Definitions

The following tables contain scientific terms, measures, and abbreviations, some of which may require explanation that you may need to understand the sampling data.

AL (Action Level): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

ALG (Action Level Goal): The level of a contaminant in drinking water below which there is no known or expected risk to health. ALG’s allow for a margin of safety.

Avg: Regulatory compliance with some MCL’s is based on running annual average of monthly samples.

Date of Sample: If a date appears in this column, the Illinois EPA requires monitoring for this contaminant less than once per year because the concentrations do not frequently change. Therefore, some of this data may be more than one year old. If no date appears in the column, monitoring for this contaminant was conducted during the CCR calendar year.

Highest Level Detected: This column represents the highest single sample reading of a contaminant of all the samples collected during the CCR calendar year.

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MLCG’s as feasible using the best available treatment technology.

MCLG (Maximum Contaminant Level Goal): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

MRDL (Maximum Residual Disinfectant Level): The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

MRDLG (Maximum Residual Disinfectant Level Goal): The level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

N/A: Not applicable.

ND: Not detectable at testing limits.

NTU: Nephelometric Turbidity Units. Used to measure cloudiness in water.

%≤0.3 NTU: Percent of samples less than or equal to 0.3 NTU.

pCi/L: picocuries per liter (a measure of radioactivity).

ppb: parts per billion, or micrograms per liter = µg/l or one ounce in 7,350,000 gallons of water.

ppm: parts per million, or milligrams per liter = mg/l or one ounce in 7,350 gallons of water.

Range of Detections: This column represents a range of individual sample results, from lowest to highest that were collected during the CCR calendar year.

TT (treatment Technique): A required process intended to reduce the level of a contaminant in drinking water.
### Water Quality Data for the Village of Lombard - 2022

</tbody>
</table>

The following table is the water quality results for the Village of Lombard’s stand-by wells. The Village does not pump or blend well water with Lake Michigan water received from the DuPage Water Commission into the water distribution system. These wells are maintained and tested regularly for use in the event of an emergency only.

**NOTE:** The state requires monitoring for certain contaminants less than once per year as concentrations of these contaminants do not change frequently. Some of the data, though accurate, is more than one year old.

### Water Quality Data Table Footnotes

**Turbidity:** Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of water quality and the effectiveness of our filtration system and disinfectants.

**Unregulated Contaminants:** A maximum contaminant level (MCL) for this contaminant has not been established by either state or federal regulations, nor has mandatory health effects language. The purpose for monitoring this contaminant is to assist USEPA in determining the occurrence of unregulated contaminants in drinking water, and whether future regulation is warranted.

**Fluoride:** Fluoride is added to the water supply to help promote strong teeth. The Illinois Department of Public Health recommends an optimal fluoride range of 0.7 mg/l with a range of 0.6 mg/l to 0.8 mg/l (mg/l = ppm).

*Note:* The Village of Lombard does not add fluoride to the water. The City of Chicago adds fluoride to the water at the Water Purification Plants and remains in the same concentration to your home.

**Sodium:** There is not a state or federal MCL for sodium. Monitoring is required to provide information to consumers and health officials that are concerned about sodium intake due to dietary precautions. If you are on a sodium-restricted diet, you should consult a physician about his level of sodium in the water.
Water Conservation and Your Water Meter

Water conservation is something that we all should practice. Except for the air we breathe, water is the single most important element in our lives and too precious to waste! Did you also know that the average U.S. household uses approximately 100 gallons per person per day?

You can play a role in conserving water and save yourself some money in the process by becoming conscious of the amount of water your household is using and by looking for ways to use less whenever you can. It isn’t hard to conserve water, here are a few tips:

- Replace old fixtures with Watersense high efficiency models that use 20% less water (toilets, faucets, and showerheads).
- Teach your kids and yourself to limit showers to 3 – 5 minutes, turn off the tap while brushing teeth and shaving, make it a family effort to reduce water consumption and maybe even lower your water bill!
- Reduce outdoor water use – 1/3 of the average household water use is outdoors, behavior changes and transition to native plantings and alternative watering methods can create substantial savings. Lawns typically only need 1 inch of water per week. Watering should be done before 10:00 am or after 6:00 pm to avoid peak evapotranspiration.
- Fix your leaking toilets and faucets. These repairs are usually inexpensive and only take a few minutes to complete. You can check your toilets for leaks by adding a small amount of food coloring to the water tank – if the food coloring makes it into the bowl without flushing, you have a leak.

Our commercial consumers can join in as well!
- Replace your old pre-rinse spray valves – you will be amazed at the savings you will see.
- Promote water conservation practices in hotels and restaurants, such as reusing linens for multi-night stays.

The Village’s meters and meter reading system will allow residents to see when and where you are using the most water, set up leak alerts, find helpful tips to conserve water and find leaks, as well as pay your water bill. Your water meter can be your ally! Sign up for the customer WaterSmart Portal at:

lombard.watersmart.com

Give us a call or visit the Village’s web page for instructional videos on how to sign up and use the portal. If you have questions regarding your new water meter, meter reading, an estimated bill, or a high bill due to excessive consumption, please call the Water Billing Division at 630-620-5920 for help.
Protect Against Cross-Connections

Every household plumbing has a cross-connection. Cross-connections occur when potable water – safe drinking water – connects to any contaminated source. During the summer, we use more water by washing our cars, filling swimming pools, or fertilizing our lawns with a hose sprayer. It is important to know how to protect our water system. Here are a few places in the home where a cross-connection can exist:

- Laundry sinks and wash basins – a hose threaded onto these faucets and left in buckets are cross-connections.
- Swimming pools
- Lawn irrigation systems – you should be testing your backflow device annually by a certified inspector…
- Garden hose connections to fertilizer sprayers.

If a cross-connection is not properly protected and there is a drop-in water pressure, untreated sources of contaminants can be drawn into your household plumbing system and into the Village’s distribution system, which is known as backflow.

Here is what you can do to prevent backflow:

- Do not use a hose to open a clogged drain
- Do not leave a hose submerged in water while filling a bucket or pool
- Do not leave fertilizer applicators attached to a hose while not in use
- If you have an underground irrigation system, make sure that a proper Cross-Connection Control Device Inspector (CCCDI) inspects and certifies your backflow device
- Use a hose bib vacuum breaker, which is a simple and inexpensive device that can be installed on faucets to prevent backflows

Miscellaneous Public Works Information

Want to report a concern? Visit the Village web page and click on the “Report a Concern” tab at the bottom to enter an online request for service. You can also login check on existing requests for updates. The online request tracker is not monitored 24-hours a day so if you have a life safety emergency please call 9-1-1.

What do I do in case of a Public Works emergency? The Public Works Department office hours are Monday through Friday from 8:00 a.m. to 4:30 p.m. During these hours, call 630-620-5740. If an emergency occurs after business hours, call the Police non-emergency phone number 630-873-4400 and they will contact the on-call Public Works Supervisor to assist you with your emergency.
